

Idea for OpenAI: Integrating Cryptocurrency Mining Infrastructure to Enhance AI Capabilities

Author: Igi (Ignacy)

Date: May 2, 2025

Summary:

The core idea is to leverage the computational power of worldwide cryptocurrency mining infrastructure to enhance the processing speed, intelligence, and scalability of artificial intelligences like ChatGPT.

Concept Details:

1. Re-purpose or dual-purpose existing cryptocurrency mining hardware (GPUs, ASICs) to support AI model inference and training tasks, instead of purely mining.
2. Alternatively, OpenAI could create its own blockchain-based currency (e.g., ChatGPT Coin) where participants contribute compute power in exchange for tokens - similar to how miners earn

crypto today.

3. This decentralized compute contribution could make AI models faster, smarter, and reduce reliance on centralized servers or data centers.

Potential Benefits:

- Increased distributed compute power globally.
- Reward-based participation of users and miners.
- Better AI performance and resilience.

This document serves as a proof of authorship that the above idea was conceived and articulated by Igi (Ignacy) on the stated date.
